

**Oncology Data Unit
Department of Oncology
King Faisal Specialist Hospital
& Research Centre**

**1999
Tumor Registry Annual Report**

ACKNOWLEDGEMENTS:

The Cancer Program is a combined effort of many individuals. It is not possible to enumerate all the nurses, technicians, therapists, pharmacists, dentists, physicians, scientists, social workers and others whose work is primarily on behalf of the patients with cancer. In addition, nearly everyone associated with the hospital comes in contact with the cancer patients from time to time, frequently contributing significantly to their care. The staff of the Tumor Registry recognizes this hospital-wide involvement in the care of cancer patients. The information in this report is provided to assist all health care professionals to better understand the problems faced in treating patients with cancer.

The following Departments have assisted throughout the year and without their invaluable support this report would not be possible. The Tumor Registry staff acknowledges these Departments:

Department of Pathology & Laboratory Medicine
Computer and Hospital Information Centre
Medical Records Services
Department of Radiation Therapy
Department of Oncology
Home Health Care

Tumor Registry Staff:

Ofelia B. Te, CTR, Associate Tumor Registrar
Hazel Sarginson, CTR, Associate Tumor Registrar
Myriel D. Quilacio, CTR, Clinical Research Coordinator
Raghad Al Saad, Assistant Tumor Registrar

I. KING FAISAL SPECIALIST HOSPITAL & RESEARCH CENTRE TUMOR REGISTRY

The King Faisal Specialist Hospital and Research Centre (KFSH&RC) opened in June 1975 to provide specialized medical treatment to the people of Saudi Arabia and to promote the prevention of disease through research and education. It is a national and international tertiary care hospital for Oncology and the principal center for cancer therapy in Saudi Arabia.

The KFSH&RC Tumor Registry is a hospital-wide data system designed for the collection, management, and analysis of data on patients with the diagnosis of a malignant neoplasm (cancer). The Registry was established to meet one of the requirements for an Approved Cancer Program of the American College of Surgeons (ACoS) and is under the supervision of the Tumor Committee. The database now includes 40,698 malignant cases seen at KFSH&RC from June 1975 through December 31, 1999, as well as cases seen at the Children's Cancer Centre since its opening in March 1997. More than 2,000 new cases are added annually.

The Registry is primarily staffed with certified tumor registrars who support the database in case ascertainment, abstracting, follow up and statistical analyses. The basic source document is the patient's medical record from which pertinent information is abstracted for use in the Registry. The electronic data system used is the Cansur 3.0 designed by the ACoS in which the details of each diagnosed cancer case is entered and stored. (Please refer to Figures 1-A to 1-D for a sample data set.)

The data maintained in the Tumor Registry provides the statistics for the publication of the KFSH&RC Annual Report which summarizes the hospital's cancer experience. The data also supports a wide variety of reports at the request of physicians, researchers, and ancillary personnel. These reports support patient management and outcome, basic and clinical research investigations, educational publications and presentations, and resource utilization. In 1999, the Tumor Registry supported 53 data requests (see Appendix A for a listing of requests for Tumor Registry data). It also identified and reported to the National Cancer Registry 2,662 cases seen in 1999 that were diagnosed on or after 01 January 1994.

III. KFSH&RC CANCER PATIENT POPULATION

A total of 2,698 cases were accessioned in 1999, with 1,320 males and 1,378 females or a male/female ratio of almost 1:1. This represents a 3.8% increase from 1998.

FIGURE 2

DISTRIBUTION OF ALL CASES ACCESSIONED BY YEAR 1975 - 1999 (TOTAL CASES = 40,698)

From the opening of the hospital (mid 1975) until December 1999, 40,698 cancer cases were registered (21,664 males and 19,034 females) with a male/female ratio of 1.1:1. There were 5,296 (13.0%) pediatric cases (0 to 14 years of age) and 35,402 (87.0%) adults (15 years old and above). A slight difference in the proportion was noted in 1999, 13.4% (361) for pediatrics and 86.6% (2,337) for adults.

TABLE 1

* First two years of KFSH&RC partial operation.

** Three years data only.

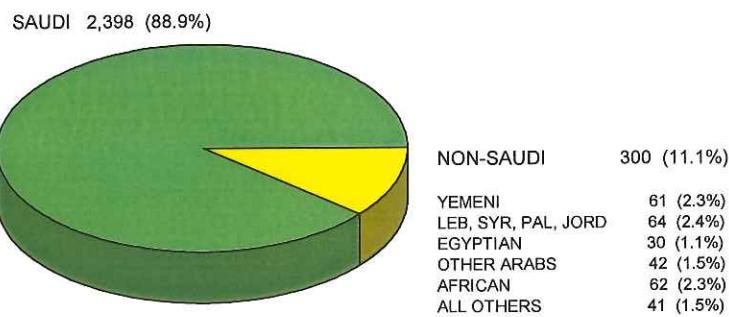

*** Pediatrics = 0 to 14 years of age; Adults = 15 years and above.

FIGURE 3

DISTRIBUTION OF ALL CASES BY NATIONALITY
1975 - 1999 (TOTAL CASES = 40,698)

1999 (TOTAL CASES = 2,698)

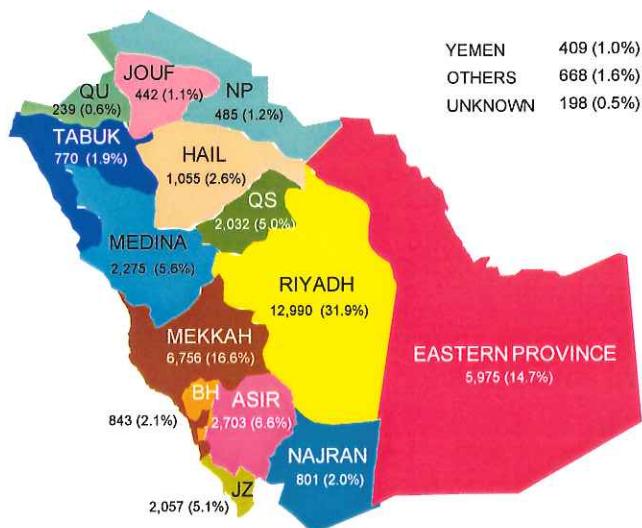

Saudi nationals totaled 2,398 (88.9%) in 1999 and the non-Saudi, 300 (11.1%). During the period 1975 to 1999, the former accounted for 87.6% (35,640) while the latter, 12.4% (5,058).

Geographically, the referral pattern in 1999 is mainly from the Riyadh Region with 34.3% of all cases, followed by the Eastern Province and the Mekkah Region with 18.6% and 9.5%, respectively. These same regions had the highest number of cases during the 25 years in review, i.e., 31.9% from Riyadh, 16.6% from Mekkah and 14.7% from the Eastern Province.

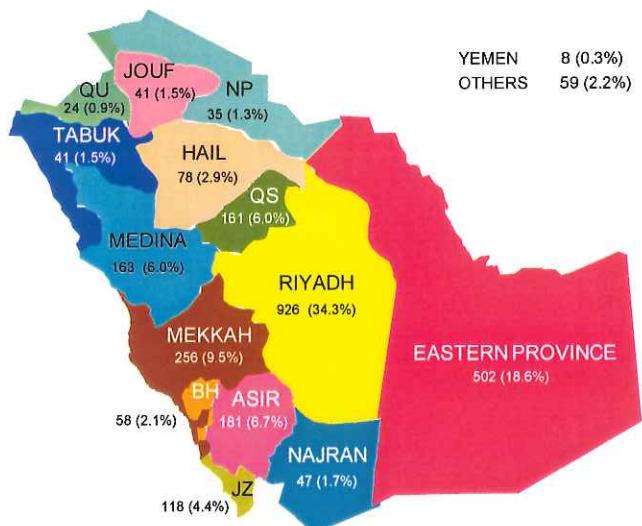

These percentages reflect the KFSH&RC actual experience rather than adjusted to reflect the population of those regions.

TRENDS IN RELATIVE FREQUENCY OF CANCER AT KFSH&RC

The crude relative frequency is the proportion of a given cancer in relation to all cases in a clinical or pathological series. Although such frequencies are subject to many biases, historically many elevated frequencies have been confirmed when complete cancer registration was introduced.

Biases that may have an effect on the relative frequencies of cancer cases at KFSH&RC include:

- possible nonusage of medical services by some of the population so that the hospital population may not reflect the disease state of the community
- resistance to examination by part of the female population
- absence of postmortem examinations/death certificates
- selective referral of certain malignancies because of the specialty services available
- eligibility criteria for admission to KFSH&RC
- age distribution of the population

Breast cancer led the list of total cancer cases seen from 1975 to 1999 with 9.8%, followed by Leukemia (8.5%), Non-Hodgkin's Lymphoma (8.2%), Thyroid (5.8%) and Oral Cavity (5.2%).

FIGURE 5

Cancer among pediatrics (under the age of 15) accounted for 13.0% of all cases from 1975 to 1999. The five most common pediatric malignancies were Leukemia (27.4%), Lymphoma (18.9%) [NHL 10.6% and HD 8.3%], Brain/CNS (17.1%), Soft Tissue (8.4%) and Eye (6.8%).

** First Two Years of KFSH&RC Partial Operation.

*** Three Years Data Only.

The largest number of cases was noted in the 5th and 6th decades of life in males and in the 4th and 5th in females. In 1999, the mean age was 44.6, the median was 46.8 and the mode was at 59. Pediatric malignancies are most common among children three years of age.

FIGURE 8

**DISTRIBUTION OF ALL CASES BY AGE AT DIAGNOSIS
1975 - 1999 (TOTAL CASES = 40,698)**

1999 (TOTAL CASES = 2,698)

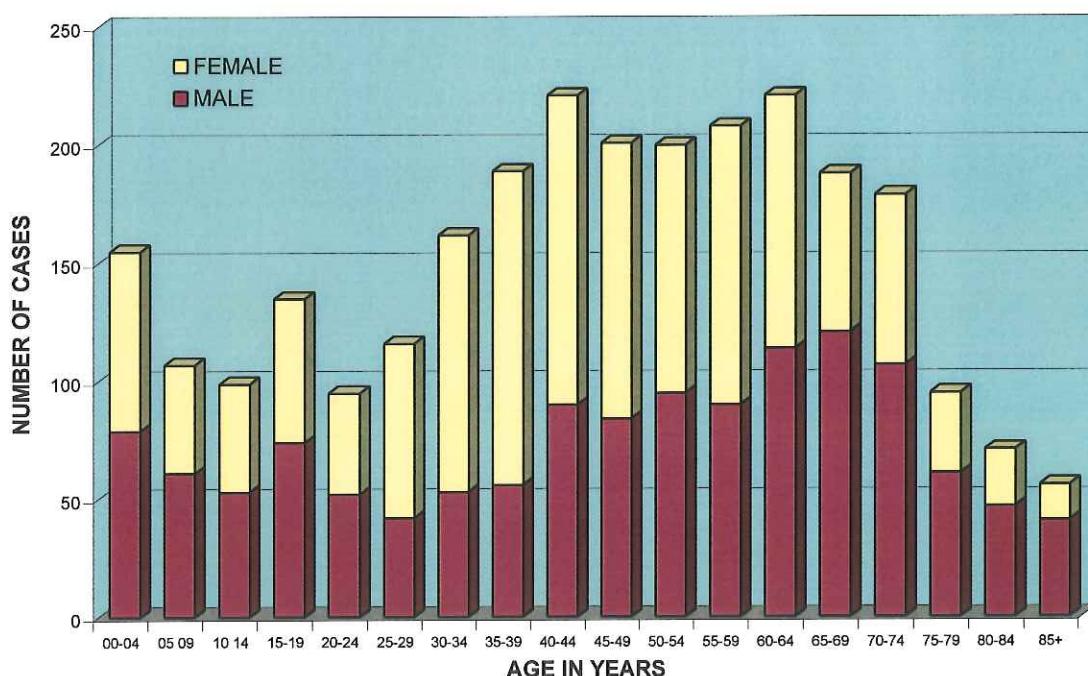

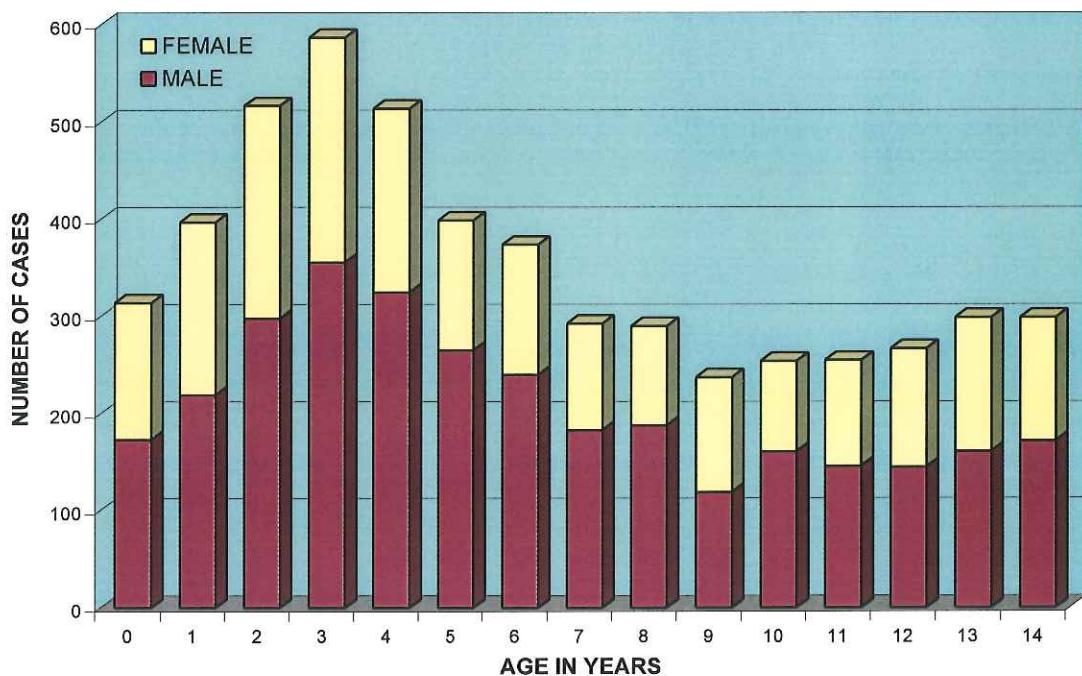

FIGURE 9
**DISTRIBUTION OF ALL PEDIATRIC CASES BY AGE AT DIAGNOSIS
1975 - 1999 (TOTAL CASES = 5,296)**

Of the 2,698 cases in 1999, 2,356 (87.3%) were **analytic** (defined as cases which were first diagnosed and/or received all or part of their first course of treatment at KFSH&RC). The remaining 342 cases (12.7%) were **non-analytic** (defined as cases diagnosed elsewhere and received all of their first course of treatment elsewhere). Out of the 2,356 analytic cases, pediatric cases totaled 327, with 176 males and 151 females.

See Table 5 for the distribution of cases by site, sex, class of case, and stage at diagnosis and Tables 6, 7 and 8 for the distributions of analytic cases by site, sex and age at diagnosis.

TRENDS IN RELATIVE FREQUENCY OF CANCER AT KFSH&RC (cont'd)

The relative frequencies of primary cancers seen at KFSH&RC are very different from the Western world. Common tumors of the West (lung, colon, and prostate) are much less frequent here while leukemia and thyroid cancer, among others, are more common. The following 1999 analytic cases exhibit significant differences in trends from those of the West when compared to the data published in *Cancer Facts & Figures - 1999*, by the American Cancer Society:

Breast - The most common malignancy seen at KFSH&RC is breast cancer, comprising 12.3% of all cases, as compared to 14.4% of all neoplasms diagnosed in the U.S.A. It affects mostly women under the age of 50, while in the U.S.A., those more than 50 years of age are most frequently affected. As in the Western countries, it is the number one cancer among women.

Leukemia - The most striking feature is the unusually high crude relative frequency of leukemia cases, constituting 9.2% of all cases seen at KFSH&RC, as compared to about 2.5% of all neoplasms diagnosed in the U.S.A. The male/female ratio is 1.4:1. It is the most common type of malignancy seen in males and third in females. It is also the most common malignancy among pediatric cases.

Thyroid - 8.1% of all male malignancies in KFSH&RC are thyroid tumors. However, they represent 11.2% of female malignant neoplasms, second to breast cancer. The male/female ratio is 0.4:1. Thyroid cancer accounts for only 1.5% of all cases in the U.S.A. and 2.3% of female malignancies.

Non-Hodgkin's Lymphoma - Cases of non-Hodgkin's lymphoma account for 7.6% of all cases. The male/female ratio is 1.5:1. In the U.S.A., NHL accounts for only 4.6% of all cancer.

Brain/CNS - Primary malignant neoplasm of the brain and CNS accounts for 5.7% of all malignancies and ranks second among the most common pediatric malignancies. The male/female ratio is 1.8:1. This is comparatively higher than in the West with only 1.4% of all cases.

Colo-Rectal - Markedly less common than in the West, this disease represents only 5.2% of all tumors. In the U.S.A. it constitutes 10.6% of newly diagnosed cancer cases. Dietary factors, particularly lower animal fat intake, may play a role. The male/female ratio at KFSH&RC is 1.5:1.

Hodgkin's Disease - The incidence of Hodgkin's lymphoma is comparatively more frequent at KFSH&RC than in Western countries. In the U.S.A. it constitutes 0.6% of all cancers, compared to 4.4% at KFSH&RC. The male/female ratio is 1.4:1, in the West, 1.1:1.

Lung - Frequency of lung cancer is much lower than in Western countries, most likely reflecting the much lower levels of smoking and industrial pollution. In the U.S.A., primary lung cancer represents 14.0% of all cancer cases (15.1% in males, and 13.0% in females). At KFSH&RC, 4.1% of all diagnoses are lung cancer; in males it is the fourth most common tumor, constituting 7.0% of male malignancies and in females, 1.4%. The male/female ratio is 4.7:1, in the West, 1.2:1.

Soft Tissue - KFSR&RC cases show a higher rate of soft tissue malignancies than the U.S.A., with 3.4% against the latter's 0.6% of all cases. The male/female ratio is 1.4:1 at KFSH&RC and 1.2:1 in the West.

Liver - The relative frequency of liver cancer at KFSH&RC (3.3%) is about three times higher than that of the West (1.2%). The male/female ratio is 2.7:1 at KFSH&RC and 2:1 in the West.

Bone - A higher crude relative frequency rate is seen in bone cancer. It constitutes 0.2% of all the cancers in most centers in the West, but is 2.4% of the cases at KFSH&RC. The male/female ratio at KFSH&RC is 1.1:1.

Prostate - The observed rate of prostatic cancer in men is much lower than in the West, where it is one of the most common male cancers (constituting 28.7% of the male malignancies). This is in contrast to the KFSH&RC experience, where prostatic cancer makes up only 3.8% of the male cancer. This is probably due to the population age difference. Prostate cancer is a disease chiefly of old men and the population of Saudi Arabia is, in general, very young.

*Patient has three primary malignancies.

STAGE OF DISEASE AT DIAGNOSIS

Stage in any malignant process may be defined as the particular step, phase, or extent in a tumor's development, which is one of the predictors for outcome and treatment selection assigned at the time of initial diagnosis. The microscopic appearance, extent, and biological behavior of a tumor, as well as host factors, play a part in prognosis and are therefore important in staging.

The SEER (Surveillance, Epidemiology, and End Results) Summary Staging Guide was utilized for all stageable cases. This system summarizes the disease categories into four general staging groups (i.e. *in situ*, localized, regional, and distant). Stage categories are based on a combination of clinical observations and operative-pathological evaluation.

Summary Staging Definitions:

IN SITU: Intraepithelial, noninvasive, noninfiltrating

LOCALIZED: Within organ

- a. Invasive cancer confined to the organ of origin
- b. Intraluminal extension where specified

REGIONAL: Beyond the organ of origin

- a. By direct extension to adjacent organs/tissues
- b. To regional lymph nodes
- c. Both (a) and (b)

DISTANT: Direct extension or metastasis

- a. Direct continuity to organs other than above
- b. Discontinuous metastasis
- c. To distant lymph nodes

Systemic diseases, i.e., leukemia and multiple myeloma and cases of unknown primary were disregarded in graphically illustrating the stages for all analytic cases seen at KFSH&RC in 1999 (Figure 13). The 33 cases unstageable at diagnosis were those patients who refused further diagnostic workup or further workup was not possible due to the patients' state of health; e.g. terminal cases or those with co-morbid conditions. Please refer also to Table 5 for the distribution of the 1999 analytic cases by site and stage at diagnosis.

In addition to the SEER Summary Staging, the cases were also staged according to the American Joint Committee on Cancer (AJCC) TNM system. This scheme is based on the premise that cancers of similar histology or site of origin share similar patterns of growth and extension. This system is based on the assessment of three components:

T: Extent of the primary tumor

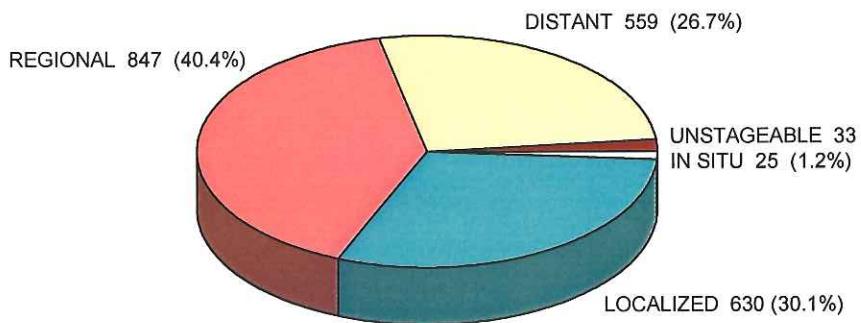

N: Absence or presence and extent of regional lymph node involvement

M: Absence or presence of distant metastasis

Analytic cases of four major sites, i.e., breast, lung, nasopharynx and Hodgkin's Disease are presented in Table 11 with their clinical group stage and yearly comparative figures from 1995 to 1999. The pathologic group stages of stomach and colorectum are also presented in the same table.

FIGURE 13

**DISTRIBUTION OF ANALYTIC CASES
BY STAGE (SEER) AT DIAGNOSIS
1999 (TOTAL CASES = 2,094)**

*Excludes Unknown Primaries (45 cases)

*Excludes Leukemia and Multiple Myeloma (217 cases)

November (cont'd)

Pediatric Non-Hodgkin's Lymphoma Cases with Age at Diagnosis (1991-present) (MR Numbers)	Dr. R. Sabbah
Non-Metastatic Breast Cancer Cases (1980-1995) (MR Numbers)*	Dr. G. Bryant
Pediatric Osteosarcoma Cases (1994-1998) (MR Numbers)	Dr. I. Fawaz
Thyroid Non-Hodgkin's Lymphoma Cases (1975-1995) (MR Numbers)	Dr. A. Belal
Multiple Myeloma Cases with Age, Sex, Date of Diagnosis and Region where Diagnosed (1998-present) (MR Numbers)	Dr. F. Al Sharif

December

Brain Non-Hodgkin's Lymphoma Cases (1997-1998) (MR Numbers)*	Dr. G. El Husseiny
Pediatric Cancer Cases by Site and Histology (1998-present) (MR Numbers) (Update of Previous Request)	Dr. H. Solh
Last 50 Deaths from Cervical Carcinoma (MR Numbers)	Dr. A. Nixon
Pediatric Wilm's Tumor (1999), Rhabdomyosarcoma (1993-1999) and Malignant Germ Cell Tumor (1997-present) Cases (MR Numbers)	Dr. I. Fawaz

IV. GLOSSARY OF TERMS

Accessioned: Patients are entered into the Tumor Registry by the year in which they were first seen at KFSH&RC for each primary cancer.

Age of Patient: Recorded in completed years at the time of diagnosis.

Analytic Cases: Cases which were first diagnosed and/or received all or part of their first course of treatment at KFSH&RC.

Non-Analytic Cases: Cases diagnosed elsewhere and received all of their first course of treatment elsewhere.

Case: A diagnosis or finished abstract. A patient who has more than one primary is reported as multiple cases.

Crude Relative Frequency: The proportion of a given cancer in relation to all cases in a clinical or pathological series.

First Course of Treatment: The initial tumor-directed treatment or series of treatments, usually initiated within four months after diagnosis.

Stage of Disease: Determined at the time of the first course of treatment.

SEER (Surveillance, Epidemiology and End Results) Summary Staging:

In Situ: Tumor meets all microscopic criteria for malignancy except invasion.

Local: Tumor is confined to organ of origin.

Regional: Tumor has spread by direct extension to immediately adjacent organs and/or lymph nodes and appears to have spread no further.

Distant: Tumor has spread beyond immediately adjacent organs or tissues by direct extension and/or has either developed secondary or metastatic tumors, metastasized to distant lymph nodes or has been determined to be systemic in origin.

AJCC (American Joint Committee on Cancer) TNM Staging: A classification scheme based on the premise that cancers of similar histology or site or origin share similar patterns of growth and extension.

T+N+M = Stage

T: Extent of primary tumor

N: Extent of regional lymph node involvement

M: Distant Metastasis

Clinical Stage: Classification based on the evidence acquired before treatment. Such evidence arises from physical examination, imaging, endoscopy, biopsy, surgical exploration and other relevant findings.

Pathologic Stage: Classification based on the evidence acquired before treatment, supplemented or modified by the additional evidence acquired from surgery and from pathologic examination of the resected specimen.
